

Important Winterization Rules

Although there are many different techniques one can utilize to winterize a pool, it is important that regardless of whatever method you or your pool professional chooses that you include the following few simple rules:

- Never drain your pool below the skimmer opening.
- Never let your pool overflow.
- Remove the pool water from all equipment and all plumbing pipes that are at or above the frost line.
- Do not remove water from a pool cover without simultaneously adding the same amount of water to the pool.
- Never allow exterior water to overflow into your pool.

Liberty Composite Pools recommends that you consult and hire a local pool builder, plumber, or pool service professional that has been trained to winterize swimming pools and swimming pool equipment in your area. You should always consider requesting references from the servicing company to give you the confidence that they understand winterization techniques for your area. Additionally, please have your servicing professional contact Liberty Composite Pools if they have any questions specific to winterizing a fiberglass pool shell.

Myths About Winterization

- Your pool needs to be drained down 2' to be winterized correctly.
- You cannot remove the water from plumbing pipe without draining your pool.
- Draining your pool below the inlets also drains the pipes.
- It's OK to let the pool overflow.
